

UNIFIND

University Lost & Found Web Platform

A centralized way for King Saud University students to report missing items, discover relevant reports, and manage their own submissions.

FULL-STACK WEB APPLICATION

20

survey responses

5

UAT participants

3

architecture tiers

Selected evidence from the IT320 team release report; not a production deployment claim.

The problem we set out to solve

Lost-item updates are often scattered across messaging groups, making reports hard to find, compare, or revisit. UniFind organizes this information in a dedicated university platform.

DISCOVERY RESEARCH

20

questionnaire responses

80%

reported losing an item on campus

85%

said they would definitely or probably use a central website

Core product capabilities

01 Structured reports

Submit item reports with a category, item details, location, date, and image.

02 Search & sort

Find relevant reports using keywords, categories, and newest/oldest sorting.

03 Saved reports

Bookmark reports to revisit without repeating a search.

04 Report management

Edit or delete your own reports and manage personal profile information.

05 Account workflows

Register, sign in, and access user-specific features.

06 Administration

View and manage submitted reports through administrative interfaces.

System architecture & data model

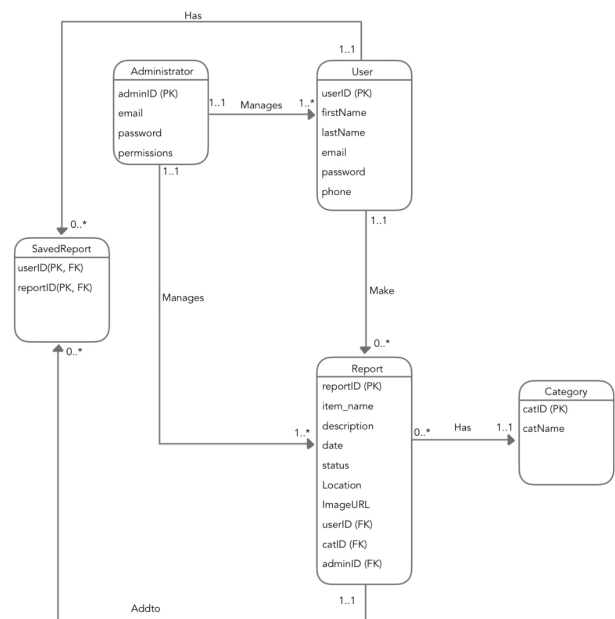

The documented design uses three tiers to separate the web interface, application logic, and relational data storage.

Three-tier architecture

Presentation / Application / Data

Design-stage ER diagram

Conceptual entities: users, reports, categories, saved reports, administrators.

TECHNOLOGY STACK

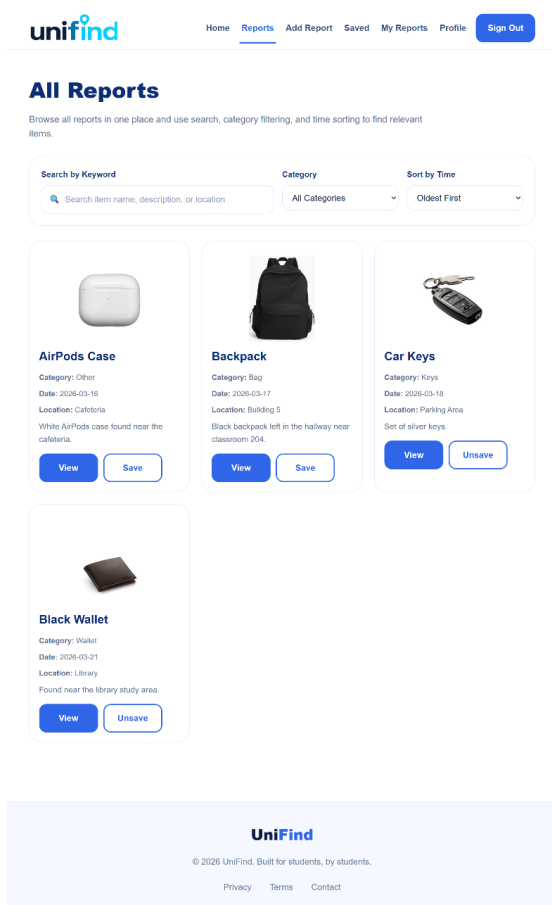

Frontend	HTML5 / CSS3 / JavaScript
Backend	PHP
Data	MySQL / MySQLi

Design-stage diagrams: report pp. 24-27. Implementation schema: unifind_db.sql.

A look inside UniFind

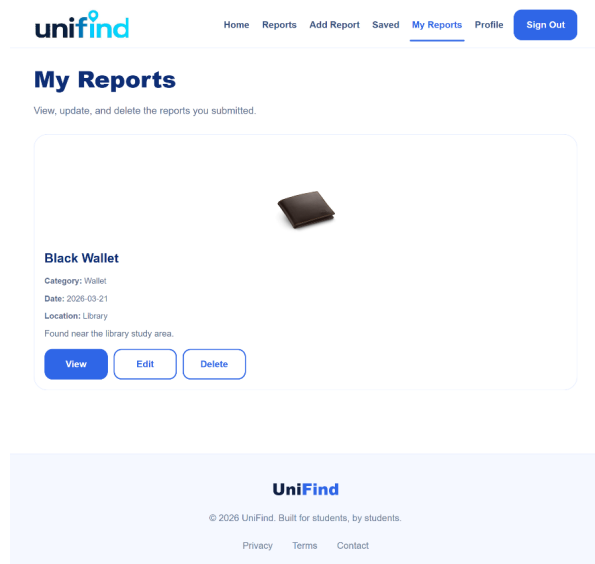

The report includes screenshots of two implemented user workflows. The images below are taken from the team documentation, not generic mockups.

Browse all reports

Search, filter, sort, view, and save item reports.

Manage my reports

Review and update personal submissions.

MAIN INTERACTION FLOW

Sign up / log in → publish or browse reports → search and save → edit or delete owned reports

Interface image sources: team report pp. 39-40.

How the project was evaluated

The team documented user-story acceptance tests, integration checks, and user acceptance testing (UAT). The results below are from a small five-person UAT sample.

Interpretation: Positive means Agree or Strongly Agree. Results describe five participants and must not be generalized to all students or presented as production benchmarks.

TESTING COVERAGE

User-story testing covered registration, login, submissions, image upload, viewing, search, sorting, saved reports, editing, deletion, and navigation. Integration checks were also documented for key workflows.

DOCUMENTED LIMITATIONS AND FUTURE WORK

The current project is focused on King Saud University. It does not include automatic lost/found matching or user notifications. Suggested improvements include notifications, intelligent matching, mobile access, and support for additional institutions.

PROJECT CREDIT

Developed collaboratively by a five-member King Saud University IT320 student team. Contributors are credited in the original team release report.
